 Automated Scheduler for Office Hours

Spring 2024

# Quick Refresher from Last Week [1]

- ✓ Understand when can we scrape data (i.e., `robots.txt`)
- ✓ Scrape a webpage Using 
- ✓ Utilize loops to scrape data from multiple webpages

# Quick Refresher from Last Week [2]

## A Note on HTML Element vs Elements for Tables

In office hours, I was asked a question related to the impact of using `[[[]]]` on the output from `html_table()` when `step2` utilizes `html_element()` vs `html_elements()`. So let us examine the [Miami Football Wikipedia Page](#) to: (a) answer this question; and (b) see the impact of `html_element()` vs `html_elements()` when there are multiple tables of the same class.

# Learning Objectives for Today's Class

- Describe what we mean by an API
- Explain how APIs will be a huge part of your career as a business analyst and/or data scientist
- Use APIs for extracting web data

# What is an API?

## (A Web Server Based Perspective)

# What is an API? [1]

- An **API** is an acronym for application programming interface.
- It is a **popular** approach to interact with an application/service or data since it:
  - Defines a set of functionalities independent of implementation (i.e., it only exposes information that a programmer might find useful and keep those parts consistent even if the implementation changes later)
  - Provides some level of privacy/control over one's internal data and the rate at which it can be accessed.

# What is an API? [2]

# What is an API? [3]

**Scenario:** Alone, you went into a warehouse and are trying to retrieve 3 screwdrivers, a toolbox, and 15 Phillips screws. But you do not know, where those things are in the warehouse.

The API is the set of instructions provided by the warehouse manager on where/how to retrieve this information without touching/accessing other things in there.

# API Useages for Business Analysts and Data Scientists

# Application #1: Request Data from Web Server

This is the **classical** example, which was explained in the previous slides and we will be coding several in-class demos to illustrate how to perform such operations in .

# Application #2: Access Python Libraries

The screenshot shows the pandas API reference website. The top navigation bar includes the pandas logo, links for 'Getting started', 'User Guide', 'API reference' (which is underlined and highlighted), 'Development', and 'Release notes'. On the right, there is a search bar with the text 'Search' and 'Ctrl + K', a version dropdown set to '2.2 (stable)', and social media icons for GitHub, Twitter, and Medium. A left sidebar contains a tree view of the API reference, with 'Input/output' expanded and 'pandas.read\_csv' selected. The main content area displays the title 'pandas.read\_csv' and the beginning of its function signature: `pandas.read_csv(filepath_or_buffer, *, sep=_NoDefault.no_default, delimiter=None, header='infer', names=_NoDefault.no_default, index_col=None, usecols=None, dtype=None, engine=None, converters=None, true_values=None, false_values=None, skipinitialspace=False, skiprows=None, skipfooter=0, nrows=None, na_values=None, keep_default_na=True, na_filter=True, verbose=_NoDefault.no_default, skip_blank_lines=True, parse_dates=None, infer_datetime_format=_NoDefault.no_default, keep_date_col=_NoDefault.no_default, date_parser=_NoDefault.no_default`.

API reference > Input/output > pandas.read\_csv

## pandas.read\_csv

`pandas.read_csv(filepath_or_buffer, *, sep=_NoDefault.no_default, delimiter=None, header='infer', names=_NoDefault.no_default, index_col=None, usecols=None, dtype=None, engine=None, converters=None, true_values=None, false_values=None, skipinitialspace=False, skiprows=None, skipfooter=0, nrows=None, na_values=None, keep_default_na=True, na_filter=True, verbose=_NoDefault.no_default, skip_blank_lines=True, parse_dates=None, infer_datetime_format=_NoDefault.no_default, keep_date_col=_NoDefault.no_default, date_parser=_NoDefault.no_default`

# Application #3: Use a Pretrained ML Model

Please click on the ["Watch on Vimeo"](#) to see OpenAI's explanation of their DALL·E 2 model.

# Accessing APIs in

# The 3 Step Process

Before you dive into the API documentation, you **should first check if there is a R (or Python if you are familiar)** package/library that serves as a wrapper for that API.

- **Find** the **API's documentation** and find information about the following:
  - A. Does the API require an **authentication key**?
  - B. What are the API's **base URL** and **query parameters**?
  - C. How does the request URL look like?
- Craft your **request**. My recommendations are to:
  - A. First, start with a simple request.
  - B. Test that request in your browser and see what results you get.
- Construct that request in **R** by **either**:
  - A. If the generated content seems to be a **JSON** file/webpage, you can capitalize on the reading the content from `jsonlite::fromJSON()`; **OR**
  - B. By passing the **base url** inside the `httr::GET()` and parsing the results with `httr::content()`.

# Demo 1: Accuweather API

---

## Demo Description

---

## Code and Results

- Go to <https://developer.accuweather.com/> and create an account.
- Add your first app (from the MY APPS tab) and copy the generated API key.
- Then using the API Reference Tab → Locations API → City Search → find the location key for Oxford, Ohio
- Use this information in the Forecast API to obtain the 5 Day Forecasts for Oxford Ohio.

# Demo 2: The CryptoCompare API

---

## Demo Description

---

## Code and Results

- Create a Personal (Free) account at [CryptoCompare.com](https://cryptocompare.com)
- Click on create your free key to create your API key and copy the key.
- Go to the [documentation](#), and test their sample call by executing the call after you have pasted your API key in the call.
  - The executed call returns the price of BTC (Bitcoin) in USD, JPY and EUR.
- Now click on the Historical Data Tab on the left
  - Click on Daily Pair OHLCV and Execute the Sample Call for BTC
  - This returns 10 days worth of OHLCV for BTC in USD.
- Let us obtain the price for \$SHIB over the past 100 days.

# Recap

# Summary of Main Points

By now, you should be able to do the following:

- Describe what we mean by an API
- Explain how APIs will be a huge part of your career as a business analyst and/or data scientist
- Use APIs for extracting web data

# Things to Do to Prepare for Next Class

- Getting Started with http
- Managing secrets
